

## **IN THE CLAIMS**

1. Claim 1 (currently amended): A holder fuse device comprising:

a base,

two planar conductor blades secured to said base and extended outward of said base,

each of said planar conductor blades including a groove formed therein and defined between two ears, and including an opening formed therein and communicating with said groove thereof, said groove of each of said planar conductor blades including a width smaller than that of said opening of said planar conductor blades, and each of said planar conductor blades including a conductor extension extended out of said base and having a polygonal cross section,

a fuse member including two ends engaged into said opening of said planar conductor blades via said grooves of said planar conductor blades, said ends of said fuse member including a diameter greater than that of said opening of said planar conductor blades, to secure and retain said ends of said fuse member in said opening of said planar conductor blades, and

a cover secured to said base, to shield and to retain said fuse member and said planar conductor blades in said base, and to prevent said fuse member from being disengaged from said base.

Claims 2, 3 (canceled).
